

**Humidification of air in the Dräger Incubator 8000 series**

All Dräger Incubators have a unique active and bactericidal humidification system. This avoids common problems of bacterial growth in water-baths and similar systems by boiling the humidifier's water. Bacteria which might have been present in the water tank are killed. The powerful system allows a relative humidity up to 85% in the entire patient area. More information can be obtained from:

**Air filters**

Air filters ensure that only clean air enters the Incubator. The filters are easy to access and to change.
